PRIORITY DATE CLAIMED

19 March 1999

TITLE OF INVENTION

COMPOSITE MATERIALS CONTAINING AN IMPACT-RESISTANT FILM

APPLICANT(S) FOR DO/EO/US

Atanas Tomov, et al.

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:

1. ☒ This is a FIRST submission of items concerning a filing under 35 U.S.C. 371.
2. ☐ This is a SECOND or SUBSEQUENT submission of items concerning a filing under 35 U.S.C. 371.
3. ☒ This express request to begin national examination procedures (35 U.S.C. 371(f) at any time rather than delay examination until the expiration of the applicable time limit set in 35 U.S.C. 371(b) and PCT Articles 22 and 39(I).
4. ☒ A proper Demand for International Preliminary Examination was made by the 19th month from the earliest claimed priority date.
5. ☒ A copy of the International Application as filed (35 U.S.C. 371(c)(2))
 - a. ☐ is transmitted herewith.
 - b. ☒ has been transmitted by the International Bureau (see accompanying PCT Form 308).
 - c. ☐ is not required, as the application was filed in the United States Receiving Office (RO/US).
6. ☒ A translation of the International Application into English (35 U.S.C. 371(c)(2)).
7. ☐ Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371(c)(3)).
 - a. ☐ are transmitted herewith (required only if not transmitted by the International Bureau).
 - b. ☐ have been transmitted by the International Bureau.
 - c. ☐ have not been made; however, the time limit for making such amendments has NOT expired.
 - d. ☒ have not been made and will not be made.
8. ☐ A translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)).
9. ☐ An oath or declaration of the inventor(s) (35 U.S.C. 371(c)(4)).
10. ☐ A translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371(c)(5)).

Items 11. to 16. below concern other document(s) or information included:

11. ☒ An Information Disclosure Statement under 37 CFR 1.97 and 1.98.
12. ☐ An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.
13. ☒ A FIRST preliminary amendment.
☐ A SECOND or SUBSEQUENT preliminary amendment.
14. ☐ A substitute specification.
15. ☐ A change of power of attorney and/or address letter.
16. ☒ Other items or information:
 - a. International application (PCT Publication No. WO 00/56744)
 - b. PCT Request (PCT/RO/101)
 - c. Form PCT/IB/308
 - d. International Search Report (Form PCT/ISA/210)
 - e. Form PCT/IB/306
 - f. Form PCT/IPEA/416 and PCT/IPEA/409 (International Preliminary Examination Report)
 - g. Form PCT/IPEA/408 (Opinion)
 - h. Form PCT/IB/332
 - i. Form PCT/IPEA/401 (Demand)
 - j. Form PCT/ISA/220
 - k. Form PCT/IB/304
 - l. Form PCT/IB/301

PRELIMINARY AMENDMENT

Assistant Commissioner for Patents
Washington, DC 20231

Sir:

Prior to or concurrent with calculation of the filing fees, please amend this application as follows.

IN THE SPECIFICATION:

On page 1, after the title, please add the paragraph heading "Field of the Invention";

On page 1, after the first paragraph, please add the paragraph heading "Background of the Invention";

On page 2, line 17, please add the paragraph heading "Description of the Invention";

On page 16, line 23, please add the paragraph heading "Examples";

Applicants have attached to this Amendment a document entitled "Amended Specification." Please insert the indicated paragraph at the end of the present specification (page 20, line 6).

IN THE CLAIMS:

Please delete claims 1-45. Please insert new claims 46-94 as shown in the document entitled "Clean Version of the Claims".

20100201 20696660

REMARKS

Entry and consideration of this Preliminary Amendment are respectfully requested prior to or concurrent with calculation of the filing fees. This Preliminary Amendment is being filed to correct improper multiple dependencies. As so amended, the claims are submitted as appearing in proper multiple dependent form.

Examination on the merits is awaited.

AUTHORIZATION

No additional fee is believed to be necessary.

The Commissioner is hereby authorized to charge any additional fees, which may be required for this amendment, or credit any overpayment to Deposit Account No. 02-4300, Order No. 33808.158.

In the event that an extension of time is required, or which may be required in addition to that requested in a petition for an extension of time, the Commissioner is requested to grant a petition for that extension of time which is required to make this response timely and is hereby authorized to charge any fee for such an extension of time or credit any overpayment for an extension of time to Deposit Account No. 02-4300, Order No. 33808.158.

Respectfully submitted,
SMITH, GAMBRELL & RUSSELL, LLP

AMENDED SPECIFICATION

Although the invention has been described in conjunction with specific embodiments, it is evident that many alternatives and variations will be apparent to those skilled in the art in light of the foregoing description. Accordingly, the invention is intended to embrace all of the alternatives and variations that fall within the spirit and scope of the appended claims. The foregoing references are hereby incorporated by reference.

SUPPLEMENTAL PRELIMINARY AMENDMENT

Assistant Commissioner for Patents
Washington, DC 20231

Sir:

Please amend this application as follows.

IN THE CLAIMS:

In claim 72, line 2, please change "emulsfying" to --emulsifying--.

Claim 83, line 2, please change "constiuents" to --constituents--.

REMARKS

Entry and consideration of this Supplemental Preliminary Amendment are respectfully requested. This Supplemental Preliminary Amendment is being filed to correct minor typographical errors.

Examination on the merits is awaited.

Respectfully submitted,
SMITH, GAMBRELL & RUSSELL, LLP

CLAIMS

46 - A catalytic system comprising:

(A) at least one ligand represented by formula (I):

where:

- E and E' each represent independently an oxygen or a sulfur atom;
- X and X' each represent independently a phosphorus, arsenic or antimony atom;
- the radicals R¹ and R'¹, which are identical or different, are selected from:

- . hydrogen;
- . linear, branched or cyclic alkyl radicals;
- . aryl radicals;
- . arylalkyl radicals;
- . alkylaryl radicals;
- . halogens;
- . the hydroxyl radical;
- . alkoxide radicals;
- . - C -OR', where R' represents a hydrocarbon

$\begin{array}{c} \parallel \\ \text{O} \end{array}$

- . radical which has from 1 to 15 carbon atoms;
- . -SO₃Y, where Y is selected from Li, Na, NH₄⁺, NR''₄⁺, where R'' represents a hydrocarbon radical which has from 1 to 15 carbon atoms;
- the R², R'², R³, R'³, R⁴ and R'⁴ radicals, which are identical or different, are selected from linear,

branched or cyclic alkyl radicals, and arylalkyl radicals;

- R is a divalent radical; and

(B) at least one nickel compound selected from:

5 (B1) nickel complexes with a zero oxidation state, which are represented by the general formula (II):

where R^a and R^b each represent independently a hydrogen atom, or a linear, branched or cyclic alkyl radical or aryl, arylalkyl or alkylaryl radical, which have up to 8 carbon atoms, it being also possible for R^a and R^b to form together a divalent aliphatic group of 2 to 10 carbon atoms and have up to three olefinic double bonds as the only carbon-carbon unsaturated groups;

25 (B2) π -allylnickels, which are represented by the formula (III):

10 in which:

- the R^c , R^d , R^e , R^f and R^g radicals, which are identical or different, are selected from hydrogen, linear, branched or cyclic alkyl radicals and aryl, arylalkyl or alkylaryl radicals, having up to 8 carbon atoms;
- the dotted lines represent the electron delocalization on the three contiguous carbon atoms;
- an R^c or R^d radical may also form, with an R^e or R^f or R^g radical, a divalent alkene group having from 2 to 10 carbon atoms and able to have up to three olefinic double bonds; and
- Z represents a halogen, an alkoxy group or an alkanoyloxy group;

25 (B3) compounds of the bis(allyl)nickel type which are represented by the(IV):

in which:

- the radicals R^c to R^g , and $R^{c'}$ to $R^{g'}$, which are identical or different, are selected from hydrogen, linear, branched or cyclic alkyl radicals and aryl, arylalkyl or alkylaryl radicals having up to 8 carbon atoms;
- the dotted lines represent the electron delocalization on the three contiguous carbon atoms;
- a radical R^c or R^d also able to form, with a radical R^e or R^f or R^g , a divalent alkene group having from 2 to 10 carbon atoms and able to have up to three olefinic double bonds;
- a radical $R^{c'}$ or $R^{d'}$ also able to form, with a radical $R^{e'}$ or $R^{f'}$ or $R^{g'}$, a divalent alkene group having from 2 to 10 carbon atoms and able to have up to three olefinic double bonds.

47 - The catalytic system as claimed in claim 46, wherein, in formula (I), E and E' are separated by intermediate atoms linked together by covalent or coordinate bonds.

48 - The catalytic system as claimed in claim 46, wherein, in formula (I), the minimum number of atoms between E and E' is from 3 to 40.

49 - The catalytic system as claimed in claim 46, wherein, in formula (I), R is selected from:

- . divalent hydrocarbon radicals comprising from 2 to 38 carbon atoms; and
- . the 1,1'-ferrocenylene radical which is substituted or unsubstituted.

50 - The catalytic system as claimed in claim 46, wherein the ligand of formula (I) comprises one of the following structures:

where R represents a 5,6-bicyclo[2.2.1]hept-2-ene radical; $-(\text{CH}_2)_4-$ or $-(\text{CH}_2)_8-$;

where R represents a 5,6-bicyclo[2.2.1]-hept-2-ene radical; or $-(\text{CH}_2)_8-$;

where 1,1'-Fc represents a-1,1'-ferrocenylene radical; and

where R^1 represents H or Ph or SO_3Na or $-\text{C}(=\text{O})-\text{O}-\text{CH}_3$.

51 - The catalytic system as claimed in claim 46, wherein the nickel compound (B₁) is selected from:

- . bis(1,5-cyclooctadiene)nickel(0);
- . bis(cyclooctatetraene)nickel(0); and
- 5 . bis(1,3,7-octatriene)nickel(0).

52 - The catalytic system as claimed in claim 46, wherein, in a nickel compound (B₂) or (B₃), a π -allyl group has from 3 to 12 carbon atoms which do not have other aliphatic unsaturated groups, except where it contains a
10 closed cycle.

53 - The catalytic system as claimed in claim 46, wherein the nickel compound (B₂) is selected from:

- . π -allylnickel chloride;
- . π -allylnickel bromide;
- 15 . π -crotylnickel chloride;
- . π -methylallylnickel chloride;
- . π -ethylallylnickel chloride;
- . π -cyclopentylallylnickel bromide;
- . π -cyclooctenylnickel chloride;
- 20 . π -cyclooctadienylnickel chloride;
- . π -cinnamylnickel bromide;
- . π -phenylallylnickel chloride;
- . π -cyclohexenylnickel bromide;
- . π -cyclododecenylnickel chloride;
- 25 . π -cyclododecatrienylnickel chloride;
- . π -allylnickel acetate;
- . π -methylallylnickel propionate;
- . π -cyclooctenylnickel octoate;
- . π -cyclooctenylnickel methoxylate; and
- 30 . π -allylnickel ethoxylate.

54 - The catalytic system as claimed in claim 46, wherein the nickel compound (B₃) is selected from:

- . bis(π -allyl)nickel;
- . bis(π -methallyl)nickel;
- 35 . bis(π -cinnamyl)nickel;
- . bis(π -octadienyl)nickel;
- . bis(π -cyclohexenyl)nickel;
- . π -allyl- π -methallylnickel; and

201020 2059550

. bis(π -cyclooctatrienyl)nickel.

55 - The catalytic system as claimed in claim 46, wherein the components (A) and (B) are present in amounts such that the nickel-to-ligand(s) molar ratio is between 1 and 100.

56 - The catalytic system as claimed in claim 55, wherein the components (A) and (B) are present in amounts that the nickel-to-ligand(s) molar ratio is between 2 and 50.

57 - A process for the polymerization of at least one olefin in the presence of a catalytic system as defined in claim 46.

58 - The process as claimed in claim 57, wherein:

- in a first step, each of the constituents (A) and (B), which are in solution in an inert solvent, are introduced separately or simultaneously into a reactor, together with the reaction mixture; and
- in a second step, the olefin or olefins are introduced, the (co)polymerization taking place at a temperature between 0 and 300°C and at a total absolute pressure of from 1 to 200 bar.

59 - The process as claimed in claim 58, wherein the constituents (A) and (B) are introduced in a nickel-to-ligand(s) molar ratio of between 1 and 100.

60 - The process as claimed in claim 59, wherein the constituents (A) and (B) are introduced in a nickel-to-ligand(s) molar ratio of between 2 and 50.

61 - The process as claimed in claim 58, wherein the inert solvent of constituents (A) and (B) is selected from saturated aliphatic hydrocarbons, saturated alicyclic hydrocarbons, aromatic hydrocarbons and mixtures thereof.

62 - The process as claimed in claim 58, wherein the reaction mixture consists of an organic medium.

63 - The process as claimed in claim 58, wherein the reaction mixture comprises a continuous liquid aqueous phase, which comprises more than 30% water by weight.

64 - The process as claimed in claim 63, wherein the aqueous phase is the only liquid phase.

65 - The process as claimed in claim 63, wherein the mixture comprises an organic liquid phase.

66 - The process as claimed in claim 62, wherein the medium or the organic phase is selected from:

- 5 - saturated aliphatic hydrocarbons, saturated alicyclic hydrocarbons, aromatic hydrocarbons and mixtures thereof; and
- to the extent that the polymerization conditions keep them in liquid form, α -olefins, unconjugated dienes and mixtures thereof.

67 - The process as claimed in claim 63, wherein the polymerization medium comprises a dispersing agent.

68 - The process as claimed in claim 67, wherein the dispersing agent is present at up to 10% by weight for the weight of water.

69 - The process as claimed in claim 68, wherein the dispersing agent is present at 0.01 to 5% by weight for the weight of water.

70 - The process as claimed in claim 63, wherein the polymerization medium comprises an emulsifying agent.

71 - The process as claimed in claim 70, wherein the emulsifying agent is present at up to 10% by weight, for the weight of water.

72 - The process as claimed in claim 71, wherein the emulsifying agent is present at 0.01 to 5% by weight for the weight of water.

73 - The process as claimed in claim 70, wherein the emulsifying agent is present in an amount greater than the critical micelle concentration.

74 - The process as claimed in claim 73, wherein the amount of emulsifying agent is enough so that the polymerization takes place mainly in the micelles.

75 - The process as claimed in claim 70, wherein the polymerization medium comprises a liquid organic phase and a cosurfactant.

76 - The process as claimed in claim 75, wherein the polymerization mixture comprises a liquid organic phase and a cosurfactant.

77 - The process as claimed in claim 76, wherein the cosurfactant has a solubility in water of less than 1×10^{-3} mol per liter at 20°C.

78 - The process as claimed in claim 76, wherein the cosurfactant is present at up to 10% by weight for the weight of water.

79 - The process as claimed in claim 76, wherein the emulsifying agent to cosurfactant mass ratio goes from 0.5 to 2.

80 - The process as claimed in claim 58, wherein the concentration of the constituent (A) in the inert solvent is between 0.1 micromol and 100 millimol per liter of solution.

81 - The process as claimed in claim 58, wherein the concentration of the constituent (B) in the inert solvent is between 0.1 micromol and 200 millimol per liter of solution.

82 - The process as claimed in claim 58, wherein it is carried out in an inert atmosphere.

83 - The process as claimed in claim 58, wherein in a preliminary step, the constituents (A) and (B) in solution are brought into contact with each other in their inert solvent, for a duration of 30 seconds to 10 minutes, before their introduction into the reaction mixture, this precontacting step being carried out in an inert atmosphere, at a temperature of between 0 and 100°C.

84 - The process as claimed in claim 83, wherein this precontacting step is carried out at a temperature between 10 and 70°C.

85 - The process as claimed in claim 58, wherein the constituents (A) and (B), which are in solution in their inert solvent, are introduced separately into the reaction mixture, the latter being held at a temperature of from 0 to 100°C.

86 - The process as claimed in claim 85, wherein the reaction mixture is held at a temperature from 10 to 70°C.

87 - The process as claimed in claim 58, wherein the (co)polymerization is carried out at a temperature of between 25 and 200°C.

88 - The process as claimed in claim 58, wherein the (co)polymerization is carried out at a total absolute pressure of from 1 to 100 bar.

89 - The process as claimed in claim 58, wherein the olefin or olefins intended to be polymerized are introduced in gas or liquid form, with enough stirring of the polymerization medium.

90 - The process according to claim 58, wherein the olefins are selected from ethylene, α -olefins, cyclic olefins and compounds of formula:

in which:

- n is an integer between 2 and 20; and
- G is a radical chosen from:
-OH; CHOHCH_2OH ; OT; $-\text{CF}_3$; $-\text{COOT}$; $-\text{COOH}$;
-Si(OH)₃; -Si(OT)₃;

T is a hydrocarbon radical having from 1 to 20 carbon atoms.

91 - The process as claimed in claim 58, wherein at least one olefin is ethylene.

92 - The process as claimed in claim 70, wherein the polymerization is carried out in the presence of an emulsifying agent, leading therefore to a latex, if necessary after a filtration step.

93 - The process as claimed in claim 92, wherein the latex is a high-density polyethylene or a medium-density polyethylene or a low-density polyethylene.

94 - The process as claimed in claim 71, wherein the emulsifying agent is present at up to 0.01 to 5% by weight, for the weight of water.

PROCESS FOR THE POLYMERIZATION OF OLEFINS IN THE PRESENCE OF
NICKEL COMPLEXES AND CORRESPONDING CATALYTIC SYSTEM

The present invention relates to the polymerization of olefins in the presence of a bimetallic
5 complex of nickel formed *in situ*.

The polymers of ethylene and other olefins are of considerable commercial attraction. The applications of these polymers are extremely numerous, from low molecular weight products for lubricants and greases, to higher
10 molecular weight products for manufacturing fibers, films, molded articles, elastomers, etc. In the majority of cases, the polymers are obtained by catalytic polymerization of olefins by means of a transition-metal-based compound. The nature of this compound has a very strong effect on the
15 properties of the polymer, its cost and its purity. Given the importance of polyolefins, there is a continuous need to improve the catalytic systems and to provide new ones thereof.

There is a variety of homogeneous or heterogeneous
20 catalysts for polymerizing or copolymerizing ethylene. Among the best-known families, mention may be made, for example, of the catalysts of the "Ziegler" type involving organometallic complexes of group III and IV metals or catalysts of the "Phillips" type involving chromium
25 complexes. However, there are also nickel-based catalysts used in particular for a number of years for producing α -olefins. In addition, some systems have a degree of tolerance toward polar media.

Among the numerous catalytic systems mentioned in
30 the literature, the association between a nickel complex, such as bis(1,5-cyclooctadiene), with benzoic acid derivatives such as 2-mercaptobenzoic acid or 3,5-diaminobenzoic acid (US-A-3 637 636) or with chelating tertiary organophosphorus ligands (US-A-3 635 937,
35 US-A-3 647 914) or even with glycolic, thioglycolic or thiolactic acids (US-A-3 661 803) has, for example, been described. The use of a nickel complex in its zero

- E and E' each represent independently an oxygen or a sulfur atom;
- X and X' each represent independently a phosphorus, arsenic or antimony atom;
- 5 - the radicals R^1 and R'^1 , which may be identical or different, are chosen from:
 - . hydrogen;
 - . linear, branched or cyclic alkyl radicals;
 - . aryl radicals;
 - 10 . arylalkyl radicals;
 - . alkylaryl radicals;
 - . halogens;
 - . the hydroxyl radical;
 - . alkoxide radicals;
 - 15 . $\begin{array}{c} \text{C} - \text{OR}' \\ || \\ \text{O} \end{array}$, where R' represents a hydrocarbon radical which may have from 1 to 15 carbon atoms;
 - 20 . $-\text{SO}_3\text{Y}$, where Y is chosen from Li, Na, NH_4^+ , NR''_4^+ (where R'' represents a hydrocarbon radical which may have from 1 to 15 carbon atoms) ;
 - the R^2 , R'^2 , R^3 , R'^3 , R^4 and R'^4 radicals, which
 - 25 may be identical or different, are chosen from linear branched or cyclic alkyl radicals, and arylalkyl radicals; and
 - R is a divalent radical; and

(B) at least one nickel compound chosen from:

- 30 (B1) nickel complexes of zero oxidation state, which can be represented by the general formula (II):

where R^a and R^b each represent independently a hydrogen atom, or a linear, branched or cyclic alkyl radical or aryl, arylalkyl or alkylaryl radical, which may have up to 8 carbon atoms, it being possible for R^a and R^b to form together a divalent aliphatic group of 2 to 10 carbon atoms and be able to have up to three olefinic double bonds as the only carbon-carbon unsaturated groups;

(B2) π -allylnickels, which can be represented by the general formula (III):

in which:

- the R^c , R^d , R^e , R^f and R^g radicals, which may be identical or different, are chosen from hydrogen, linear, branched or cyclic alkyl radicals and aryl, arylalkyl or alkylaryl radicals, having up to 8 carbon atoms;
- the dotted lines represent the electron delocalization on the three contiguous carbon atoms;
- an R^c or R^d radical may form, with an R^e or R^f or R^g radical, a divalent alkene group having from 2 to 10 carbon atoms and able to have up to three olefinic double bonds; and
- Z represents a halogen, preferably a chlorine or bromine atom, an alkoxy group or an alkanoyloxy group, these groups possibly having in particular from 1 to 10 carbon atoms;

(B3) compounds of the bis(allyl)nickel type which can be represented by the general formula (IV):

in which:

- the radicals R^e to R^g , and $R^{e'}$ to $R^{g'}$, which may be identical or different, are chosen from hydrogen, linear, branched or cyclic alkyl radicals and aryl, arylalkyl or alkylaryl radicals having up to 8 carbon atoms;
- the dotted lines represent the electron delocalization on the three contiguous carbon atoms;
- a radical R^c or R^d able to form, with a radical R^e or R^f or R^g , a divalent alkene group having from 2 to 10 carbon atoms, preferably from 2 to 5 carbon atoms, and able to have up to three olefinic double bonds;
- a radical $R^{c'}$ or $R^{d'}$ able to form, with a radical $R^{e'}$ or $R^{f'}$ or $R^{g'}$, a divalent alkene group having from 2 to 10 carbon atoms, preferably from 2 to 5 carbon atoms, and able to have up to three olefinic double bonds.

In formula (I), E and E' are preferably separated by intermediate atoms linked together by covalent or coordinate bonds; again preferably, the minimum number of atoms between E and E' in formula (I) is from 3 to 40. The term minimum number of atoms between E and E' refers to the minimum number of atoms encountered in the molecule on going

from atom E to atom E' along the bonds atom by atom. By way of example, if the ligand comprises the structure:

where Ph represents a phenyl radical, the minimum number of atoms between the oxygen atoms is 6, since it is not possible to encounter fewer than 6 atoms on going from the first oxygen to the second oxygen.

Moreover, in formula (I), R is chosen in particular from:

.divalent hydrocarbon radicals comprising, for example, from 2 to 38 carbon atoms, such as alkylene, alkenylene, arylene, cycloalkylene, bicycloalkylene and alkylarylene

radicals; and

. the 1,1'-ferrocenylene radical which is possibly substituted, for example, with one or two monovalent radicals such as

$-\text{C}-\text{O}-\text{R}'$ or $-\text{SO}_3\text{Y}$, R' and where Y has the meanings

already given.

By way of examples, the ligand of formula (I) may be one of those comprising the following structures:

where R represents a 5,6-bicyclo[2.2.1]-hept-2-ene radical; $-(\text{CH}_2)_4-$ or $-(\text{CH}_2)_8-$;

where R represents a 5,6-bicyclo[2.2.1]-hept-2-ene radical; or $-(\text{CH}_2)_8^-$;

where 1,1'-F_c represents a -1,1'-ferrocenylene radical; and

where R¹ represents H or Ph or SO₃Na or $-\text{C}(=\text{O})-\text{O}-\text{CH}_3$.

The 5,6-bicyclo[2.2.1]hept-2-ene radical can be represented by:

By way of examples of nickel compounds (B₁), of the first family mentioned of olefinic nickel compounds which can be used as catalytic precursors, mention may be made of:

- . bis(1,5-cyclooctadiene)nickel(0);
- . bis(cyclooctatetraene)nickel(0); and

. bis(1,3,7-octatriene)nickel(0).

The π -allyl nickels (B2) are another family of olefinic nickel compounds which can be used as catalytic precursors. In these compounds, the nickel entity is linked
5 to a π -allyl group characterized by delocalization of the electron contribution from the π -allyl group over three contiguous carbon atoms.

In the nickel compounds (B2) and in the compounds of the nickel bis-allyl type (B3) - forming the third family
10 of olefinic nickel compounds which can be used as catalytic precursors - a π -allyl group has from 3 to 12 carbon atoms which do not have other aliphatic unsaturated groups, except if it contains a closed ring.

By way of examples of nickel compounds (B2),
15 mention may be made of:

- . π -allylnickel chloride;
- . π -allylnickel bromide;
- . π -crotylnickel chloride;
- . π -methylallylnickel chloride;
- 20 . π -ethylallylnickel chloride;
- . π -cyclopentylallylnickel bromide;
- . π -cyclooctenylnickel chloride;
- . π -cyclooctadienylnickel chloride;
- . π -cinnamylnickel bromide;
- 25 . π -phenylallylnickel chloride;
- . π -cyclohexenylnickel bromide;
- . π -cyclododecenylnickel chloride;
- . π -cyclododecatrienylnickel chloride;
- . π -allylnickel acetate;
- 30 . π -methylallylnickel propionate;
- . π -cyclooctenylnickel octoate;
- . π -cyclooctenylnickel methoxylate; and
- . π -allylnickel ethoxylate.

Although the halides (B2) above probably exist
35 independently in the form of dimers, for clarity of the present description they are mentioned in the form of monomeric species.

By way of example of nickel compounds (B3), mention may be made of:

- . bis(π -allyl)nickel;
- . bis(π -methallyl)nickel;
- 5 . bis(π -cinnamyl)nickel;
- . bis(π -octadienyl)nickel;
- . bis(π -cyclohexenyl)nickel;
- . π -allyl- π -methallylnickel; and
- . bis(π -cyclooctatrienyl)nickel.

10 Preferably, the components (A) and (B) are present in amounts such that the nickel-to-ligand(s) molar ratio is between 1 and 100, more preferably between 2 and 50.

The subject of the present invention is also a process for the polymerization of at least one olefin in the
15 presence of a catalytic system as defined above, in a diluting medium.

According to one particularly preferred embodiment of the process according to the invention,

- in a first step, each of the constituents (A) and (B),
20 which are in solution in an inert solvent, are introduced separately or simultaneously into a reactor, together with the reaction mixture; and
- in a second step, the olefin or olefins are introduced, the (co)polymerization taking place at a temperature
25 between 0 and 300°C, preferably between 25 and 250°C, and at a total absolute pressure of from 1 to 200 bar, preferably from 1 to 100 bar.

As indicated above, the constituents (A) and (B) are introduced in a nickel-to-ligand(s) molar ratio of
30 between 1 and 100, and more preferably between 2 and 50.

The inert solvent in which the constituents (A) and (B) are found for the first step is a solvent compatible with the operations to be carried out. By way of examples of such solvents, mention may be made of all those compatible
35 with the polymerization of olefins by organometallic catalysis, in particular saturated aliphatic, saturated alicyclic and aromatic hydrocarbons such as isobutane, butane, pentane, hexane, heptane, isododecane, cyclohexane,

cycloheptane, methylcyclohexane, methylcycloheptane, toluene, ortho-xylene, para-xylene and any mixture of the above compounds.

The inert solvents of each of the constituents (A) and (B) may be identical or different.

The reaction mixture of the process according to the invention may consist of an organic medium, or else it may comprise a continuous liquid aqueous phase, which comprises more than 30% water by weight. In the latter case, the aqueous phase may be the only liquid phase of the reaction mixture (except for the solutions of the constituents (A) and (B)). Also in this case, the mixture may comprise a liquid organic phase.

The concentration of the constituent (A) in the inert solvent is preferably between 0.1 micromol and 100 millimol per liter of solution; and the concentration of the constituent (B) in the inert solvent is preferably between 0.1 micromol and 200 millimol per liter of solution.

The process according to the invention is generally carried out in an inert atmosphere.

In a preliminary step, the constituents (A) and (B) can be brought into contact with each other in solution in their inert solvent, for a duration of 30 seconds to 15 minutes, preferably of 30 seconds to 10 minutes, before their introduction into the reaction mixture, this precontacting step also being carried out in an inert atmosphere, at a temperature of between 0 and 100°C, in particular between 10 and 70°C.

The constituents (A) and (B), which are found in solution in their inert solvent, may also be introduced separately in no preferred order into the reaction mixture, the latter being held at a temperature of from 0 to 100°C, in particular from 10 to 70°C.

It is possible to choose the polymerization medium (organic medium) or the organic phase of a polymerization medium comprising a liquid aqueous phase from:

- saturated aliphatic hydrocarbons, saturated alicyclic hydrocarbons, aromatic hydrocarbons and mixtures

thereof, in particular from isobutane, butane, pentane, hexane, heptane, isododecane, cyclohexane, cycloheptane, methylcyclohexane, methylcycloheptane, toluene, ortho-xylene, para-xylene and any mixture of these compounds; and

- 5 - to the extent that the polymerization conditions keep them in liquid form, α -olefins, such as propylene, butene, hexene or 4-methyl-1-pentene, unconjugated dienes, such as 1,9-decadiene, 1,5-hexadiene, 10 1,13-tetradecadiene, bicyclo[2.2.1]-hepta-2,5-diene, and mixtures thereof.

This organic medium could also be chosen from alcohols, being, for example, a monoalcohol or a diol, comprising, for example, 5 to 20 carbon atoms; ethers 15 comprising, for example, 3 to 15 carbon atoms, such as, for example, tetrahydrofuran or dioxane; and esters comprising, for example, from 2 to 15 carbon atoms, such as, for example, ethyl, butyl or vinyl acetate, or methyl acrylate.

Where the polymerization medium comprises an 20 aqueous phase, during the polymerization, the polymerization medium comprises said liquid aqueous phase, a solid phase consisting of the solid polymer arising from the polymerization, and it also comprises, depending on the physical state of the olefin to be polymerized, at least one 25 other gaseous phase and/or one other liquid phase. If an olefin to be polymerized is liquid under the conditions of temperature and pressure of the polymerization, this olefin will be able to be part of a liquid organic phase distinct from the liquid aqueous phase. Such a liquid organic phase 30 may also comprise an organic solvent, such as those indicated above, of said olefin.

The constituents of any liquid organic phase are sufficiently insoluble in water such that, given the quantity thereof involved, the aqueous phase always contains 35 more than 30% water.

Where the polymerization medium comprises two distinct liquid phases, the latter may, for example, be

present such that the phase other than the aqueous phase represents 1 to 50% by volume of the aqueous phase.

The aqueous phase may comprise at least 40%, or even at least 50%, or even at least 60%, or even at least 70%, or even at least 80% by weight of water.

The aqueous phase may comprise, in dissolved form, an organic compound which could be an alcohol or a ketone or a diol such as a glycol, for example ethylene glycol, or propanediol or butanediol. This organic compound may have the function of increasing the solubility in the aqueous phase of the olefin to be polymerized.

The polymerization medium is preferably stirred. The stirring is preferably enough to distribute the various phases uniformly in the reactor.

At least one dispersing agent can be added to the polymerization medium. Such a dispersing agent may in particular be used when the polymerization medium comprises a liquid organic phase, in which case it helps to disperse said liquid organic phase in the form of droplets surrounded by the continuous aqueous phase. In this case, since the constituents (A) and (B) have been mainly dissolved in the liquid organic phase, the polymerization takes place mainly in the droplets, the latter generally having a mean diameter of between 100 μm and 3 millimeters.

The dispersing agent may be one of those known to have this function, such as, for example, a polyvinyl alcohol, methylcellulose, a gelatine, kaolin, barium sulfate, hydroxyapatite, magnesium silicate, tricalcium phosphate, or a combination of several of these dispersing agents.

The dispersing agent may be introduced into the polymerization medium at up to 10% by weight with respect to the water used and preferably from 0.01% to 5% by weight with respect to the weight of water used.

At least one emulsifying agent can be added to the polymerization medium. The use of such an emulsifying agent is in particular recommended when it is desired that the polymerization leads to a latex, that is to say to an

ensemble of polymer particles having a number-average diameter of less than 1 micrometer, said particles being dispersed in the aqueous phase. When an emulsifying agent is used, it is not generally necessary for the polymerization medium to contain a dispersing agent.

By way of example of an emulsifying agent, it is possible to use any one of the known surfactants, whether they be anionic, nonionic or even cationic. In particular, it is possible to choose the emulsifying agent from anionic agents such as the sodium or potassium salts of fatty acids, in particular sodium laurate, sodium stearate, sodium palmitate, sodium oleate, the mixed sulfates of sodium or potassium and of a fatty alcohol, especially sodium laurylsulfate, the sodium or potassium salts of sulfosuccinic esters, the sodium or potassium salts of alkylarylsulfonic acids, in particular sodium dodecylbenzenesulfonate, and the sodium or potassium salts of monosulfonates of fatty monoglycerides, or even from nonionic surfactants such as the products of the reaction between ethylene oxide and alkylphenols. It is of course possible to use mixtures of such surfactants.

The emulsifying agent can be introduced into the polymerization medium at up to 10% by weight with respect to the weight of water, and preferably from 0.01% to 5% by weight with respect to the weight of water.

In such a process comprising an emulsifying agent and a liquid organic phase, since the constituents (A) and (B) have mainly been dissolved in said liquid organic phase, and since the amount of emulsifying agent is greater than the critical micelle concentration, the polymerization takes place in the liquid organic phase droplets, which generally have a mean diameter of between 1 μm and 1 000 μm , and in the micelles which generally have a mean diameter of between 1 nanometer and 100 nanometers. Such a process is similar to the process called "radical emulsion polymerization", except that it does not involve radicals. When, in such a process, the concentration of emulsifying agent is increased, the relative extent of the polymerization taking place in the

micelles is increased, promoting the formation of a latex at the end of polymerization. When in this case a liquid organic phase is present and when the amount of emulsifying agent is such that all the liquid organic phase is present
5 in the micelles, the process is similar to the process called "radical microemulsion polymerization", except that the polymerization does not involve radicals.

Where the polymerization medium comprises a liquid organic base and an emulsifying agent, it is possible to add
10 a cosurfactant to the medium, as happens for the polymerization processes in a miniemulsion. Such a cosurfactant generally has a solubility in water of less than 1×10^{-3} mol per liter at 20°C. Such a cosurfactant may, for example, be hexadecane or cetylalcohol. It may be
15 present at up to 10% by weight with respect to the weight of water and preferably the ratio of the mass of emulsifying agent to that of the cosurfactant ranges from 0.5 to 2. The presence of this cosurfactant makes it possible, also by means of enough shearing of the medium, to obtain droplets
20 of the liquid organic phase of less than 1 μm and promotes the formation of a latex at the end of polymerization. Enough shearing may, for example, be obtained by ultrasound or by a homogenizer (such as an apparatus of the Ultraturax or Diapix 600 type from Heidolph). Once the characteristic
25 size ($<1 \mu\text{m}$) of the droplets is obtained, stirring can be continued with less vigorous shearing, of the type of shearing used for suspension polymerization processes.

Where an organic solvent has been used, the latter can, if desired, be removed by evaporation.

30 The process according to the invention leads to polymer particles whose diameter may range from 10 nanometers to 5 millimeters.

Where the polymerization comprises an emulsifying agent, a latex is obtained. At the end of the polymerization
35 carried out in the presence of an emulsifying agent, the latex possibly contains particles having a tendency to separate by settling and it may be desirable to carry out a

separation, for example by filtration, so as to remove those particles not forming part of the latex.

The polymerization conditions, namely the amount of ingredients in the polymerization medium and the degree of conversion of monomer into a polymer, may be adapted so that the latex has a solids content ranging from 0.1 to 50% by weight.

The olefin intended to be polymerized is introduced with enough stirring of the polymerization medium, for example stirring ranging from 10 to 10 000 revolutions per minute. The olefin may be introduced in liquid or gaseous form, depending on its physical state.

The polymerization temperatures and pressures have been indicated above.

Where only ethylene is polymerized, a high-density polyethylene homopolymer is obtained. The polymerization of ethylene with at least one olefin other than ethylene leads to the production of a lower-density ethylene polymer than the abovementioned high-density polyethylene homopolymer. Depending on the amount and the type of the comonomer(s) of ethylene, it is therefore possible to obtain a high-density ethylene polymer (high-density polyethylene), or a medium-density ethylene polymer (medium-density polyethylene) or even, with a high proportion of comonomer, a low-density ethylene polymer (low-density polyethylene).

As is common practice for ethylene polymers, the term "high density" means a density greater than 0.940, medium density means that the density ranges from 0.925 to 0.940 and low density means that the density is less than 0.925.

The polymerization may therefore lead to a latex of at least one olefin, that is to say to a polymer comprising polymerized units of at least one olefin, with other units of polymerized monomer if necessary. In particular, if at least one olefin is ethylene, a latex of an ethylene polymer can be obtained.

The process according to the invention may therefore lead to a latex of a high-density ethylene polymer

or to a latex of a medium-density ethylene polymer, or even of a low-density ethylene polymer.

Within the scope of the present patent application, the term polymer must be taken in its general sense, such that it covers homopolymers, copolymers, interpolymers and polymer blends. The term polymerization must also be taken in an equivalent general sense.

The set of olefins includes that of the α -olefins. As olefins, mention may be made of ethylene, propylene, cyclopentene, 1-hexene, 3-methyl-1-pentene, 4-methyl-1-pentene, 1,4-hexadiene, 1,9-decadiene, 1-octene, 1-decene, and the cyclic olefins such as cyclohexene. The set of olefins also includes the compounds of formula $\text{CH}_2=\text{CH}-(\text{CH}_2)_n-\text{G}$ where n is an integer ranging from 2 to 20, and G represents a radical which can be chosen from the following list:

-OH, -CHOHCH₂OH, -OT, -CF₃, -COOT, -COOH, -Si(OH)₃, -Si(OT)₃, where T is a hydrocarbon radical having from 1 to 20 carbon atoms. Mention is made in particular of the cases where at least one olefin is ethylene.

The process according to the invention may be carried out in batches, semicontinuously or continuously.

The following examples illustrate the present invention without however limiting the scope thereof. In these examples, the following abbreviations have been used:

- weight-average molecular mass: \overline{M}_w
- polydispersity (weight-average molecular mass/number-average mass): $\overline{M}_w/\overline{M}_n$.

EXAMPLE 1: Polymerization of ethylene

42 ml of toluene and 67 mg of exo,endo-2,3-bis[2-methoxycarbonyl-2-(triphenylphosphoranylidene)acetyl]bicyclo[2.2.1]hept-5-ene ligand, that is a concentration of 1.9 $\mu\text{mol/ml}$ were placed in a 200 ml Schlenck tube in a nitrogen atmosphere (Solution 1).

41.2 ml of toluene and 56 mg of bis(1,5-cyclooctadienyl)nickel, that is a concentration of

4.9 $\mu\text{mol/ml}$, were placed in a second 200 ml Schlenck tube (Solution 2).

500 ml of toluene, 10 ml of Solution 2 and 5 ml of Solution 1, that is a nickel/ligand molar ratio of 5, were introduced at ambient temperature successively into a 1 liter metal reactor, fitted with a stirrer, in a nitrogen atmosphere and with stirring at 250 rpm. The reaction mixture was then kept at 1 bar nitrogen and at 65°C for 10 minutes.

10 Ethylene was then introduced so that there was an absolute pressure in the reactor of 5 bar. The pressure was kept constant throughout the polymerization by means of a continuous feed of ethylene into the reactor.

15 After one hour of polymerization, 86 g of polyethylene, that is a productivity of 8.8×10^6 g of polymer/mole of ligand, were recovered.

The polyethylene had the following characteristics:

- $\overline{M}_w = 35\ 600$ g/mol;
- 20 • $\overline{M}_w/\overline{M}_n = 10.2$;
- Melting point (measured by DSC - Differential Scanning Calorimetry) = 129.4°C

EXAMPLE 2: Polymerization of propylene

51 ml of toluene and 86 mg of exo,endo-2,3-bis-[2-methoxycarbonyl-2-(triphenylphosphoranylidene)acetyl]bicyclo[2.2.1]hept-5-ene ligand, that is a concentration of 2.6 $\mu\text{mol/ml}$, were placed in a 200 ml Schlenck tube, in a nitrogen atmosphere (Solution 3).

30 37.1 ml of toluene and 101 mg of bis(1,5-cyclooctadienyl)nickel, that is a concentration of 2.6 $\mu\text{mol/ml}$, were placed in a second 200 ml Schlenck tube (Solution 4).

500 ml of toluene, 10 ml of Solution 4 and 5 ml of Solution 3, that is a nickel/ligand molar ratio of 9.6, were introduced at ambient temperature successively into a 1 liter metal reactor, fitted with a stirrer in a nitrogen

atmosphere and with stirring at 250 rpm. The reaction mixture was then kept at 1 bar nitrogen and at 65°C for 10 minutes.

Polypropylene was then introduced so that there was an absolute pressure in the reactor of 5 bar. The pressure was kept constant throughout the polymerization by means of a continuous feed of polypropylene into the reactor.

After one hour of polymerization, a yellowish solution was recovered which, after evaporation, provide 1 g of a polymer having the appearance of a grease. The productivity was 0.1×10^6 g of polymer/mol of ligand.

- $\overline{M}_w = 6\ 941$ g/mol;
- $\overline{M}_w/\overline{M}_n = 4.5$;
- The melting point (measured by DSC) was 119°C.

EXAMPLE 3: Copolymerization of ethylene and propylene

56.8 ml of toluene and 91 mg of exo,endo-2,3-bis-[2-methoxycarbonyl-2-(triphenylphosphor-anylidene)acetyl]bicyclo[2.2.1]hept-5-ene ligand, that is a concentration of 2.0 $\mu\text{mol/ml}$, were placed in a 200 ml Schlenck tube, in a nitrogen atmosphere (Solution 5).

91.4 ml of toluene and 132 mg of bis(1,5-cyclooctadienyl)nickel, that is a concentration of 5.3 $\mu\text{mol/ml}$, were placed in a second 200 ml Schlenck tube (Solution 6).

500 ml of toluene, 20 ml of Solution 6, and 5 ml of Solution 5, that is a nickel/ligand molar ratio of 10.8, were introduced at ambient temperature successively into a 1 liter metal reactor, fitted with a stirrer in a nitrogen atmosphere and with stirring at 250 rpm. The reaction mixture was then kept at 1 bar nitrogen and at 65°C for 10 minutes.

A gas mixture of 80/20 ethylene/propylene by mass was then introduced so that the absolute pressure in the reactor was 5 bar. The pressure was kept constant throughout

the polymerization by means of a continuous feed of the 80/20 by mass ethylene/propylene mixture into the reactor.

After one hour of polymerization, 92 g of a polymer having the appearance of a grease was recovered. The productivity was 9.4×10^6 g of polymer/mol of ligand.

- $\overline{M}_w = 4\,166\text{ g/mol}$
- $\overline{M}_w/\overline{M}_n = 2.9.$

Infrared analysis of the product indicates an incorporation of propylene not exceeding 5%.

10. EXAMPLE 4: Emulsion copolymerization of ethylene and propylene

1.5 l of deionized water, through which nitrogen had bubbled for 24 h, was introduced into a 2.5 l Schlenk tube. 200 ml of this water were taken and introduced into a 15 300 ml Schlenk tube with 6 g of sodium laurylsulfate (SLS) and sparged with nitrogen for 2 hours. 3 ml of hexadecane were then added. The contents of the second Schlenk tube were reintroduced into the first tube.

35 mg of the exo, endo-2,3-bis[2-methoxycarbonyl-
20 2(triphenylphosphoranylidene)acetyl]bicyclo[2.2.1]hept-5-ene
ligand and 263 mg of bis(cis,cis-1,5-cyclooctadiene)nickel
in powder form (that is a nickel/ligand molar ratio of 22.2)
were introduced into a 200 ml Schlenck tube followed by
50 ml of toluene; the mixture was then stirred for 1 minute
25 at ambient temperature. This solution was added to the
aqueous phase. The whole was then homogenized, still in a
nitrogen atmosphere, by means of an Ultraturax homogenizer
for 1 minute at 1 500 revolutions per minute. The
mini-emulsion obtained was introduced into a 6 l metal
30 reactor fitted with a mechanical stirrer and kept at 45°C.

The reactor was placed at 2 bar of a 76/24 by mass ethylene/propylene mixture, and its temperature was raised to 65°C with stirring at 400 revolutions per minute. When the temperature had reached 65°C, the ethylene pressure was raised to 20 bar and kept constant for 1 hour.

The temperature was then reduced to 20°C and the reactor was progressively degassed over 20 minutes. 29.3 g of polymer, in the form of a dispersion which sediments slowly, was recovered. The melting point of the recovered product was 110°C.

204020-2069650

CLAIMS

1 - A catalytic system characterized in that it consists of:

- (A) at least one ligand which can be represented by the general formula (I):

where:

- E and E' each represent independently an oxygen or a sulfur atom;
- X and X' each represent independently a phosphorus, arsenic or antimony atom;
- the radicals R¹ and R'¹, which may be identical or different, are chosen from:

- . hydrogen;
- . linear, branched or cyclic alkyl radicals;
- . aryl radicals;
- . arylalkyl radicals;
- . alkylaryl radicals;
- . halogens;
- . the hydroxyl radical;
- . alkoxide radicals;
- . $\begin{array}{c} - \text{C} - \text{OR}' \\ || \\ \text{O} \end{array}$, where R' represents a hydrocarbon

radical which may have from 1 to 15 carbon atoms;

- . -SO₃Y, where Y is chosen from Li, Na, NH₄⁺, NR''₄⁺ (where R'' represents a hydrocarbon

radical which may have from 1 to 15 carbon atoms);

- the R^2 , R'^2 , R^3 , R'^3 , R^4 and R'^4 radicals, which may be identical or different, are chosen from linear, branched or cyclic alkyl radicals, and arylalkyl radicals;
- R is a divalent radical; and

(B) at least one nickel compound chosen from:

(B1) nickel complexes with a zero oxidation state, which can be represented by the general formula (II):

where R^a and R^b each represent independently a hydrogen atom, or a linear, branched or cyclic alkyl radical or aryl, arylalkyl or alkylaryl radical, which may have up to 8 carbon atoms, it being possible for R^a and R^b to form together a divalent aliphatic group of 2 to 10 carbon atoms and be able to have up to three olefinic double bonds as the only carbon-carbon unsaturated groups;

(B2) π -allylnickels, which can be represented by the general formula (III):

23

in which:

- the R^c , R^d , R^e , R^f and R^g radicals, which may be identical or different, are chosen from hydrogen, linear, branched or cyclic alkyl radicals and aryl, arylalkyl or alkylaryl radicals, having up to 8 carbon atoms;
- the dotted lines represent the electron delocalization on the three contiguous carbon atoms;
- an R^c or R^d radical may form, with an R^e or R^f or R^g radical, a divalent alkene group having from 2 to 10 carbon atoms and able to have up to three olefinic double bonds; and
- Z represents a halogen, an alkoxy group or an alkanoyloxy group;

(B3) compounds of the bis(allyl)nickel type which can be represented by the general formula (IV):

in which:

- the radicals R^e to R^g , and $R^{e'}$ to $R^{g'}$, which may be identical or different, are chosen from hydrogen, linear, branched or cyclic alkyl radicals and aryl, arylalkyl or alkylaryl radicals having up to 8 carbon atoms;
- the dotted lines represent the electron delocalization on the three contiguous carbon atoms;
- a radical R^c or R^d able to form, with a radical R^e or R^f or R^g , a divalent alkene group having from 2 to 10 carbon atoms and able to have up to three olefinic double bonds;
- a radical $R^{c'}$ or $R^{d'}$ able to form, with a radical $R^{e'}$ or $R^{f'}$ or $R^{g'}$, a divalent alkene group having from 2 to 10 carbon atoms and able to have up to three olefinic double bonds.

2 - The catalytic system as claimed in claim 1, characterized in that, in formula (I), E and E' are separated by intermediate atoms linked together by covalent or coordinate bonds.

3 - The catalytic system as claimed in either of claims 1 and 2, characterized in that, in formula (I), the minimum number of atoms between E and E' is from 3 to 40.

4 - The catalytic system as claimed in either of claims 1 to 2, characterized in that, in formula (I), R is chosen from:

- . divalent hydrocarbon radicals comprising from 2 to 38 carbon atoms; and
- . the 1,1'-ferrocenylene radical which may be substituted.

5 - The catalytic system as claimed in one of claims 1 to 4, characterized in that the ligand of formula (I) comprises one of the following structures:

where R represents a 5,6-bicyclo[2.2.1]hept-2-ene radical; $-(\text{CH}_2)_4-$ or $-(\text{CH}_2)_8-$;

where R represents a 5,6-bicyclo[2.2.1]-hept-2-ene radical; or $-(\text{CH}_2)_8-$;

where 1,1'-F_C represents a 1,1'-ferrocenylene radical; and

where R¹ represents H or Ph or SO₃Na or $-\text{C}(=\text{O})\text{O}-\text{CH}_3$.

6 - The catalytic system as claimed in one of claims 1 to 5, characterized in that the nickel compound (B_1) is chosen from:

- . bis(1,5-cyclooctadiene)nickel(0);
- 5 . bis(cyclooctatetraene)nickel(0); and
- . bis(1,3,7-octatriene)nickel(0).

7 - The catalytic system as claimed in one of claims 1 to 5, characterized in that, in a nickel compound (B_2) or (B_3), a π -allyl group has from 3 to 12 carbon atoms
10 which do not have other aliphatic unsaturated groups, except where it contains a closed cycle.

8 - The catalytic system as claimed in one of claims 1 to 5, characterized in that the nickel compound (B_2) is chosen from:

- 15 . π -allylnickel chloride;
- . π -allylnickel bromide;
- . π -crotylnickel chloride;
- . π -methylallylnickel chloride;
- . π -ethylallylnickel chloride;
- 20 . π -cyclopentylallylnickel bromide;
- . π -cyclooctenylnickel chloride;
- . π -cyclooctadienylnickel chloride;
- . π -cinnamylnickel bromide;
- . π -phenylallylnickel chloride;
- 25 . π -cyclohexenylnickel bromide;
- . π -cyclododecenylnickel chloride;
- . π -cyclododecatrienylnickel chloride;
- . π -allylnickel acetate;
- . π -methylallylnickel propionate;
- 30 . π -cyclooctenylnickel octoate;
- . π -cyclooctenylnickel methoxylate; and
- . π -allylnickel ethoxylate.

9 - The catalytic system as claimed in one of claims 1 to 8, characterized in that the nickel compound
35 (B_3) is chosen from:

- . bis(π -allyl)nickel;
- . bis(π -methallyl)nickel;
- . bis(π -cinnamyl)nickel;

- . bis(π -octadienyl)nickel;
- . bis(π -cyclohexenyl)nickel;
- . π -allyl- π -methallylnickel; and
- . bis(π -cyclooctatrienyl)nickel.

5 10 - The catalytic system as claimed in one of claims 1 to 9, characterized in that the components (A) and (B) are present in amounts such that the nickel-to-ligand(s) molar ratio is between 1 and 100.

10 11 - The catalytic system as claimed in claim 10, characterized in that the components (A) and (B) are present in amounts such that the nickel-to-ligand(s) molar ratio is between 2 and 50.

15 12 - A process for the polymerization of at least one olefin in the presence of a catalytic system as defined in one of claims 1 to 11.

 13 - The process as claimed in claim 12, characterized in that:

- in a first step, each of the constituents (A) and (B), which are in solution in an inert solvent, are introduced separately or simultaneously into a reactor, together with the reaction mixture; and
- in a second step, the olefin or olefins are introduced, the (co)polymerization taking place at a temperature between 0 and 300°C and at a total absolute pressure of from 1 to 200 bar.

25 14 - The process as claimed in claim 13, characterized in that the constituents (A) and (B) are introduced in a nickel-to-ligand(s) molar ratio of between 1 and 100.

30 15 - The process as claimed in claim 14, characterized in that the constituents (A) and (B) are introduced in a nickel-to-ligand(s) molar ratio of between 2 and 50.

35 16 - The process as claimed in one of claims 13 to 15, characterized in that the inert solvent of constituents (A) and (B) is chosen from saturated aliphatic hydrocarbons, saturated alicyclic hydrocarbons, aromatic hydrocarbons and mixtures thereof.

17 - The process as claimed in one of claims 13 to 16, characterized in that the reaction mixture consists of an organic medium.

18 - The process as claimed in claims 13 to 16, characterized in that the reaction mixture comprises a continuous liquid aqueous phase, which comprises more than 30% water by weight.

19 - The process as claimed in claim 18, characterized in that the aqueous phase is the only liquid phase.

20 - The process as claimed in claim 18, characterized in that the mixture comprises an organic liquid phase.

21 - The process as claimed in one of claims 17 and 20, characterized in that the medium or the organic phase is chosen from:

- saturated aliphatic hydrocarbons, saturated alicyclic hydrocarbons, aromatic hydrocarbons and mixtures thereof; and
- 20 - to the extent that the polymerization conditions keep them in liquid form, α -olefins, unconjugated dienes and mixtures thereof.

22 - The process as claimed in one of claims 18 to 21, characterized in that the polymerization medium comprises a dispersing agent.

23 - The process as claimed in claim 22, characterized in that the dispersing agent is present at up to 10% by weight with respect to the weight of water, in particular, at 0.01 to 5% by weight, with respect to the weight of water.

24 - The process as claimed in one of claims 18 to 23, characterized in that the polymerization medium comprises an emulsifying agent.

25 - The process as claimed in claim 24, characterized in that the emulsifying agent is present at up to 10% by weight, in particular at 0.01 to 5% by weight, with respect to the weight of water.

26 - The process as claimed in either of claims 24 and 25, characterized in that the emulsifying agent is present in an amount greater than the critical micelle concentration.

5 27 - The process as claimed in claim 26, characterized in that the amount of emulsifying agent is enough so that the polymerization takes place mainly in the micelles.

10 28 - The process as claimed in one of claims 24 to 27, characterized in that the polymerization medium comprises a liquid organic phase and a cosurfactant.

29 - The process as claimed in claim 28, characterized in that the polymerization mixture comprises a liquid organic phase and a cosurfactant.

15 30 - The process as claimed in claim 29, characterized in that the cosurfactant has a solubility in water of less than 1×10^{-3} mol per liter at 20°C.

31 - The process as claimed in either of claims 29 and 30, characterized in that the cosurfactant is present at 20 up to 10% by weight with respect to the weight of water.

32 - The process as claimed in one of claims 29 to 31, characterized in that the emulsifying agent to cosurfactant mass ratio goes from 0.5 to 2.

25 33 - The process as claimed in one of claims 13 to 32, characterized in that the concentration of the constituent (A) in the inert solvent is between 0.1 micromol and 100 millimol per liter of solution.

34 - The process as claimed in one of claims 13 to 33, characterized in that the concentration of the 30 constituent (B) in the inert solvent is between 0.1 micromol and 200 millimol per liter of solution.

35 - The process as claimed in one of claims 13 to 34, characterized in that it is carried out in an inert atmosphere.

35 36 - The process as claimed in one of claims 13 to 35, characterized in that, in a preliminary step, the constituents (A) and (B) in solution are brought into contact with each other in their inert solvent, for a duration of 30

seconds to 10 minutes, before their introduction into the reaction mixture.

37 - The process as claimed in claim 36, characterized in that this precontacting step is carried out in an inert atmosphere, at a temperature of between 0 and 100°C, in particular between 10 and 70°C.

38 - The process as claimed in one of claims 13 to 35, characterized in that the constituents (A) and (B), which are in solution in their inert solvent, are introduced separately into the reaction mixture, the latter being held at a temperature of from 0 to 100°C, in particular from 10 to 70°C.

39 - The process as claimed in one of claims 13 to 38, characterized in that the (co)polymerization is carried out at a temperature of between 25 and 200°C.

40 - The process as claimed in one of claims 13 to 39, characterized in that the (co)polymerization is carried out at a total absolute pressure of from 1 to 100 bar.

41 - The process as claimed in one of claims 13 to 40, characterized in that the olefin or olefins intended to be polymerized are introduced in gas or liquid form, with enough stirring of the polymerization medium, in particular with stirring ranging from 10 to 10 000 revolutions per minute.

42 - The process according to one of claims 13 to 41, characterized in that the olefins are chosen from ethylene, α -olefins, cyclic olefins and compounds of formula:

in which:

- n is an integer between 2 and 20; and
- G is a radical chosen from:
-OH; CHOHCH_2OH ; OT; $-\text{CF}_3$; $-\text{COOT}$; $-\text{COOH}$;
-Si(OH) $_3$; -Si(OT) $_3$;

T is a hydrocarbon radical having from 1 to 20 carbon atoms.

UNITED STATES
Patents and Design Patents
Sole & Joint Inventors
Convention & Non-convention
PCT & Non-PCT
This form cannot be amended, altered
or changed after it is signed.
(For use only for inventors who
understand the English language.)

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled

**METHOD FOR POLYMERISING OLEFINS IN THE PRESENCE OF
NICKEL COMPLEXES AND CORRESPONDING CATALYTIC SYSTEMS**

(check one) ☐ is attached hereto.

☐ was filed as U.S. Application No. _____ on September 18, 2001 and (if applicable) was amended on even date.

☒ was filed as PCT International Application No. PCT/FR00/00639 on March 16, 2000 and (if applicable) was amended under PCT Article 34 on _____.

I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above. I acknowledge the duty to disclose information which is material to patentability as defined in Title 37, Code of Federal Regulations, §1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, §119(a)-(d) or §365(b) of any foreign and PCT application(s) for patent or inventor's certificate, or §365(a) of any PCT international application which designated at least one country other than the United States of America listed in this Declaration. I have also identified below any foreign application for patent or inventor's certificate or PCT international application having a filing date before that of the application(s) on which priority is claimed:

Foreign/PCT Application No.	Country	Filing Date	Priority Claimed? (yes/no)
99/03463	France	3/19/99	Yes

I hereby claim the benefit under Title 35, United States Code, §120 or §365(c) of any United States application and PCT international application designating the United States of America listed in this Declaration and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application or PCT international application in the manner provided by the first paragraph of Title 35, United States Code, §112, I acknowledge the duty to disclose information which is material to patentability as defined in Title 37, Code of Federal Regulations, §1.56 which became available between the filing date of the prior application and the national or PCT international filing date of this application:

U.S. Application No.	Filing Date	Status (patented/pending/abandoned?)

The duty is acknowledged for the Preliminary Amendment, which is hereby incorporated by reference as part of the original disclosure.

I hereby claim priority benefits under Title 35 United States Code §119(e) of any U.S. provisional application(s) listed below:

U.S. Provisional Application No.	Filing Date

I hereby appoint the following attorneys to prosecute this application and to transact all business in the Patent and Trademark Office connected therewith: Robert G. Weilacher (20,531), Herbert M. Hanegan (25,682), Dale Lischer (28,438), Frederick F. Calvetti (28,557), J. Rodgers Lunsford, III (29,405), Michael A. Makuch (32,263), Dennis C. Rodgers (32,936), Michael K. Carrier (42,391), Eric J. Hanson (44,738), Patrick R. Delaney (45,338), and Brandon S. Boss (46,567).

Send all correspondence to: SMITH, GAMBRELL & RUSSELL, LLP, 1850 M Street, N.W. (Suite 800), Washington, D.C. 20036. All facsimiles may be sent to (202) 263-4329. Direct all phone calls to (202) 659-2811.

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.
